AMENDMENTS TO THE ABSTRACT

The Abstract as amended below with a replacement Abstract shows added text with underlining and deleted text with ~~strikethrough~~.

Please DELETE the Abstract in its entirety and replace with the following new Abstract.

An E-mail device has a first detection module of detecting that a plurality of multicast target mail destination addresses exist in a ~~hysteresis~~history, and a generating module of executing a process of generating a group formed of the plurality of mail destination addresses, corresponding to the detection. A user is thereby made to recognize an existence of a function of registering the group of the plurality of mail destination addresses, thus guiding the user to positive utilization thereof.
